Dear Bernie,

Lassenite in raw form has been written into our planting procedures forever!
I have a number of vineyards with sandy soils with little or no water holding capacity. Due to the irrigation being geared for the older vines, these sites are near impossible to establish inter planted vines. The use of Lassenite in this years replanting has seen a dramatic increase in the interplant survival rate, and the lower maintenance required has led to a massive reduction in vineyard labor costs.

This product is easy to apply and the results are more than satisfactory. In the future all new plantings will be using Lassenite in the planting medium. Congratulations on having a product with **REAL** application potential.
